CSC1223 Database Systems (Practical)

Answer All Questions

Time Allowed : Two Hours

Instructions:

- Create a text file and name it with your index number. Save SQL statements and the answers to each of the queries in the text file.
- Use MySQL statements to answer all the questions.
- You may use the data available in the file `helper.sql` to create tables.

1. Consider the following relational database schema that describes the database of a Football League Management System:

- Venue(venue_id, venue_name, city_name, aud_capacity)
- Team(team_id, won, draw, lost, points)
- Player(player_id, team_id, player_name, DOB, age)
- Matches(match_no, play_date, venue_id, stop1_sec, stop2_sec)
- Match_details(match_no, team_id, player_id)

The purpose of the Football database is to provide a comprehensive system for tracking and managing all aspects of football competitions.

- (a) Create a relational database named **BFL** with the given relational instances in the file `helper.sql` using the MySQL command prompt. [25%]
- (b) Write SQL statements for each of the following queries:
- i. Display the data definition for each of the relational schema.
 - ii. Retrieve all the tuples for each of the relational instances.
 - iii. Retrieve all details of the venues located in the city 'Bordeaux'.
 - iv. List the names and ages of all players who are older than 30.
 - v. Find the total audience capacity of all venues combined.
 - vi. List players and their teams for match number 2.
 - vii. Retrieve the names of venues where team 1204 has played.
 - viii. Find the total number of matches played in each venue.
 - ix. Retrieve the details of matches played in the venue with the highest audience capacity.
 - x. List the teams that have not won any matches.
 - xi. Retrieve the details of the match with the longest combined stoppage time.
 - xii. List the player names and team names for players who participated in more than one match. [75%]
